

SOAR | INVESTIGATION, REHEARSAL AND GOVERNED RESPONSE ONE-PAGE PRODUCT OVERVIEW · 01 / 01

PRODUCT AT A GLANCE

SOAR Product Overview

SOAR is a security investigation and governed-response workspace. It connects supplied alerts, logs and asset context to a reproducible investigation, a rehearsed proposal and human-owned response decision.

INTERFACE PREVIEW / RECORDED DEMONSTRATION

The decision

What is the next defensible response, who may authorize it and how will the result be verified?

CAPABILITY PILLAR

Investigate

WHAT THE PRODUCT DOES

Approved evidence, event window, asset context, threat intelligence and a named question.

WHAT THE TEAM CAN VERIFY

A reproducible explanation with provenance, assumptions and missing evidence.

CAPABILITY PILLAR

Rehearse

WHAT THE PRODUCT DOES

Candidate paths, digital twins, replay and specialist review of likely consequences.

WHAT THE TEAM CAN VERIFY

A proposal whose dependencies, side effects and recovery assumptions can be challenged.

CAPABILITY PILLAR

Govern response

WHAT THE PRODUCT DOES

Configured adapters, target scope, approval, expiry, execution receipt and fresh verification.

WHAT THE TEAM CAN VERIFY

An accountable response record; drafts and console outputs remain non-executing.

From signal to governed response

Reconcile the same input window, test the explanation, inspect the proposed target and side effects, require the right owner to authorize the supported path, then verify the result with fresh evidence.

Current evaluation boundary

A model narrative does not establish a breach. Replay preserves the source evidence class and is not a fresh live observation. Console output executes nothing. Active response requires a configured adapter, explicit authority, recovery and post-action verification demonstrated in the selected installation.

THE DECISION IT SUPPORTS

SOAR leaves the next analyst with reproducible evidence and the service owner with a bounded response they can assess.
